

BIO PLANTELLA YELLOW ADHESIVE PLATES

Excellent mechanical protection against a wide range of plant pests found in the vegetable garden and on fruit trees.

UNIQUE ADVANTAGES:

- With added wires for hanging.
- Long-lasting effect because of the high resistance to temperature and moisture changes.

ADVANTAGES:

- Completely natural control of aphids, Thrips spp., Greenhouse whitefly, European cherry fruit fly and other pests.
- Specifically chosen yellow color lures the pest into the trap.
- High-quality entomologic adhesive that enables quick adhesion of all pests (including the light ones) does not wash away and does not dissolve.
- No waiting periods.

USAGE:

BIO
Plantella

COMPOSITION:

Plates covered with the transparent adhesive (polyisobutylene), no added active chemical substances for plant protection.

DESCRIPTION:

The adhesive plates have a carefully chosen shade of yellow that strongly attracts numerous plant pests, such as European cherry fruit fly, various leaf-miners, codling moths, olive flies, fruit sawflies and garden pests like leaf lice, greenhouse whiteflies, flea beetles, suckers, thrips and various flies, like the onion maggot. Once the pests approach the plate they become stuck on the fast active entomological adhesive layer.

DIRECTIONS FOR USE:

In orchards, greenhouses or in open spaces distribute the plates evenly across the area using 20 – 24 pieces per 100 m². With taller garden plants (tomatoes, cucumbers) use more plates. When the adhesive layer gets excessively covered with pests replace the plate with a new one.

Place the plates near branches but make sure they do not adhere to leaves and branches. In the vegetable garden hang them on a stick, placed in the ground. During the fruit tree blossoming period remove the plates so the bees will not get caught on them.

Yellow adhesive plates can also be used for monitoring purposes to quickly and accurately determine the quantity and type of the pest population and to respond to the pest situation quickly and appropriately.
